

MINISTRY OF HEALTH

STATUS OF IMPLEMENTATION OF FREE MATERNITY  
SERVICES (FMS) PROGRAM IN THE DEVOLVED HEALTH  
SYSTEM IN KENYA

*A COMPREHENSIVE ASSESSMENT REPORT*

*January, 2015*

## FOREWORD

Maternal and Child Health has remained a high priority for the Government of Kenya and in particular the Ministry of Health (MoH). Over the years, the Government has come up with various programmes to address the various aspects facing the health sector in general as well as reproductive health. One key Government intervention was the introduction of the Free Maternity Services by H.E The President of the Republic of Kenya in his declaration of the free maternity services on 1<sup>st</sup> June 2013. The overall objective of this programme was to increase access to skilled delivery services and hence the reduction of the maternal and infant mortality.

After over one year of implementation of the program, my Ministry commissioned a study to monitor the implementation of the Free Maternity Services program in order to document areas that require policy and operational re-orientation both at National and County levels for maximum benefits of the programme. The key focus areas for the assessment included; establishing the trends of deliveries at facility level, assessment of the status of maternal health and wellbeing, assessment of availability of services, equity, quality of care and sustainability on health service provision. This study placed emphasis on the holistic and comprehensive monitoring system that adequately takes cognizance of the complexity of Universal Health Care and the need to involve all the stakeholders in the monitoring process especially through gathering their views on the program at all levels.

The study found out that Free Maternity Services Programme was a timely, noble idea with a nation wide acceptance by all health sector players including the beneficiaries of this service. Over the past one year of implementation the Ministry has recorded key milestones that included increased number of deliveries, increased uptake of antenatal care services with more mothers attending the required antenatal visits and increased favourable pregnancy outcomes.

Despite these achievements there is need for concerted efforts in addressing challenges such as inadequate amenities, inadequate equipment, inadequate human resource for health among other challenges in order to realise even more benefits of the free maternity services program.

It is my sincere hope that implementation of the assessment recommendations will rejuvenise the programme objectives and thereby lead to improved health status of women and children in this country.

Mr. James W. Macharia  
**Cabinet Secretary,  
Ministry of Health.**

## ACKNOWLEDGEMENTS

This report on the Monitoring of the Implementation of the Free Maternity Service (FMS) programme in the devolved health systems was undertaken and prepared by a team of dedicated personnel both from the Ministry of Health, WHO and the Consultants. My sincere acknowledgement goes to WHO-Kenya office for the continued support and its valuable guidance, technical and financial support that it has provided for this study. My acknowledgement goes to Dr. Jane Ong'ang'o the principal lead Consultant and Mr. Alex Mwaniki assistant consultant for their resourcefulness that ensured all processes of the study were conducted well, providing a valuable assessment of the programme.

I wish to express my appreciation to each and every one who contributed through various forms in the success of this report. My acknowledgements go to Dr. Custodia Mandlhate, the WHO/Kenya representative, together with Dr. Humphrey Cyprian Karamagi and Hillary Kipruto the WHO team for their technical inputs into the process. The Ministry of Health technical teams led by the Director of Medical Services Dr. Nicholas Muraguri, together with the Dr. Jackson Kioko, Dr. Bartilol Kigen, Dr. Isabella Maina, Dr Charles Kandie, Ms Rose Kuria and Ms Tecla Kogo for oversight and guidance into the evaluation process.

The study information and data was gathered through the support and commitment from a large team of sampled County Senior Staff, Facility Administrative teams, field supervisors, enumerators, key informants (national and at the county levels), the communities and data entry clerks. This survey could not have been undertaken without the willingness, enthusiasm and commitment of the participants to respond to the questionnaire. Gratitude is extended to all, especially those healthcare personnel, who despite their busy schedules accorded our team adequate time.

Dr. Khadijah Kassachoon,  
Principal Secretary,  
Ministry of Health.

## PREFACE

The report on the Monitoring of the Free Maternity Services Programme has presented crucial insights for improving maternal and neonatal health outcomes. The various recommendations have given the health sector and its players a new focus to improve this worthwhile programme. There is need to adopt regular assessments and monitoring and evaluation not only of this initiative but for other similar programs in the Ministry to avert unnecessary and unforeseen challenges.

The report is structured into four chapters namely; introduction, methodology, report findings and discussions, and conclusion and recommendation.

**Chapter One [1];** presents the background information highlighting the maternal and neonatal health statistics and the national bench-marking goals. It also enumerates the various Government and Ministry efforts to address the maternal and Neonatal health challenges and constraints. The rationale, goal and the report objectives have been justified within this chapter.

**In Chapter Two [2];** the report gives an account of the detailed methodological approach adopted. These included the sampling frame, sampling procedures, justification of the sample size, data collection tools and the processes, data management, analysis and report writing. It also describes the study limitations and how this can be mitigated in future work.

**Chapter Three [3];** presents the report findings in line with the objectives. It compares the maternal and Neonatal health trends before and during the programme implementation. A detailed analysis of the facility readiness was undertaken by facility levels and by County. The chapter further describes the client perception of the program as reported by those who had benefited from the service.

**Chapter Four [4];** summaries the main conclusions in line with the report objectives and it lists a number of recommendations to be considered for a successful implementation of the programme.

Dr. Nicholas Muraguri,  
**Director of Medical Services**  
**Ministry of Health**

# CHAPTER 1: INTRODUCTION

## 1.0 Introduction and Background

Maternal and child health has remained a high priority for the Government at large and for the Ministry of Health (MoH) in particular. A significant determinant of maternal health is attendance of Antenatal Care (ANC) and skilled birth attendance. Births assisted by skilled providers have averaged at 44 percent in the past few years according to Ministry of Health reports. The benefits of utilizing the community trained birth attendants cannot be gain said. The increase in the use of skilled birth attendants has the potential to significantly reduce maternal and infant deaths which are key Millennium Development Goal (MDGs) deliverables.

H.E The President of the Republic of Kenya declared maternity services free in all public health facilities on 1st June 2013 with the overall objective of increasing access to skilled delivery services thus reducing maternal and infant mortality which in effect will help Kenya in moving towards achieving the Millennium Development Goal (MDG) 4 & 5. Moreover, social health protection through Universal Health Coverage (UHC) is one of the flagship projects as per the Kenya Health Sector Strategic Plan (KHSSP) 2014-2018 and Free Maternity Services (FMS) is a major stride on the road to UHC.

## 1.1 Maternal Health in Kenya

Kenya has long suffered from high maternal morbidity and mortality rates. The most recent estimates set the maternal mortality rate at 488 deaths per 100,000 live births (KDHS 20009), well above the MDG target of 147 per 100,000 by 2015. For every woman who dies at childbirth in Kenya, it is estimated that another 20-30 women suffer serious injury or disability due to complications arising during pregnancy or delivery. These high rates have persisted despite improvements in other health indicators over the past decades. The problem is driven, at least in part, by lack of access to quality maternal health services, including ante-natal, delivery, and post-natal services. Although health sector infrastructure has grown over the past decade, many women still live at a considerable distance from health facilities, cannot afford to pay fees for maternal services, and/or face other barriers to accessing quality care. Access to skilled delivery has therefore been a particular challenge. Overall, only 44% of births in Kenya are delivered under the supervision of a skilled birth attendant, well below the target of 90% of deliveries by 2015. Traditional birth attendants continue to assist with 28% of births, relatives and friends with 21%, and in 7% of births, mothers receive no assistance at all.

## 1.2 The Rationale

There has been an observed increase in the total and proportional number of deliveries since the inception of the free maternity services program. In addition to total number of deliveries and monies disbursed, it is crucial to assess the impact free maternity services program on maternal health and wellbeing as well as accessibility of services, availability of services, equity; quality of care and sustainability on health service provision. In this regard, there is need to set up a clear, holistic and comprehensive monitoring system that adequately takes cognizance of the complexity of UHC.

The efficiency and effectiveness of the programme at all levels depends on among other things, the involvement of stakeholders in health. The stakeholders include clients/ end users of the product i.e mothers, the service providers (facility based health care workers), the health management teams; the governance teams, the national government and the community at large. Hence the need to involve all the stakeholders in the monitoring process especially through gathering their views on the program.

## 1.3 Goal

To assess the implementation of Free Maternity Services program and its effects on the health services delivery.

*Specifically the study aimed to:-*

1. To monitor the overall effects of the policy change on the health sector.
2. To establish the changes in the maternity services utilization patterns.
3. To assess the change in the quality of care being received in facilities.
4. Provide inputs for the development of the FMS policy.
5. To provide recommendations for effective and efficient implementation of the FMS programme.

## CHAPTER TWO: METHODOLOGY

### 2.1 Study Design and Scope

The study used a mixed research method to collect information from the key informants. This included qualitative and quantitative research methods. The information was collected at both levels of the Government decision making organs; The National level and the County Governments. At the National level the team sought qualitative interviews with 9 departments within the MOH and a representative of a health development partner. At the County, the key informants included County Chief Executive officer (CECs) for Health, County Health Directors and Maternity-in-charges. Questionnaires were administered to Clients (mothers) to understand their perceptions of FMS and focus group discussions (FGDs) were conducted for community members.

### 2.2 Data collection

The Research assistants and data clerks received a one day intensive training to understand the purpose of the survey and to familiarize with the data collection tools that they used to collect the data. A total of 10 teams were used to collect data in the sampled regions. The entire data collection took two weeks in the month of September 2014. To ensure quality control, each team had a team leader who supervised the collection of the data and ensured all the information required was gathered and documented accurately with regional backstopping provided by the Ministry of Health National level team. The data was collected using structured questionnaires, guided personal interviews and focused group discussion (FGDs) guidelines.

### 2.3 Sampling Procedures and Sample Size

The study used stratified random sampling in the selection of the facilities to be interviewed, the selection of the key informants and the selection of patients. To supplement the quantitative aspects 9 Focus Group Discussions (FGDs) were held in Coast, Eastern, Central, Rift Valley and in Nyanza regions. A total of 24 Counties were selected with weights as the number of facilities (*Annex 1*).

Out of the 24 Counties 360 health facilities were sampled for the assessment of facility readiness for offering the FMS. For the same facilities a tool for assessing the quantitative indicators for monitoring the FMS was administered. A total of 603 mothers who had received FMS were sampled to be interviewed on their perception of the FMS program (*Annex 2*).

## 2.4 Data Analysis

Upon the completion of the data collection exercise, a team was constituted to undertake data cleaning that included coding of the open ended statements. Two days data entry training was undertaken for the data clerks. The data was double entered into MS Access database and later exported to Statistical Package for Social Scientist (SPSS) version 22.0 and STATA version 12 for analysis. The study used descriptive analysis to answer the study objectives.

The qualitative data from the FGDs and key informant interviews was recorded on audio recorders and this was typed into scripts. There was familiarization with these scripts so as to get details of the information before breaking it into parts. During this process the major themes emerged. The themes were in the form of short phrases, ideas, or concepts arising from the texts. Quotes from the original context were arranged appropriately under the developed themes. This formed categorized data from which interpretations were made using various expressions such as; guided words, context, internal consistency, frequency and extensiveness of comments, specificity of comments, intensity of comments and big ideas.

## 2.5 Limitations

The study experienced the following setbacks:

- absolute non-response from the sampled facilities for trend indicator patterns (Some facilities did not respond to the data collection sheet on the trends analysis tool that resulted to the use of the Health Management Information System (HMIS) datasets from DHIS-2).
- Some indicators data sets are not available from DHIS-2. The DHIS data which was used to make analysis of these trends could not provide more profile on the various ANC visits (1st, 2nd, 3rd and 4th). This could have informed on attendance by number of visit. The data did not also have indicators to define the causes of maternal death, neonatal death and the proportions of live still births and macerated still births. If these specifics were clearly indicated, the quality of care would also be defined from this data. Causes of PPH also needed to be identified in this data so that targeted strategies would be designed to prevent PPH, the most common maternal complication
- The assessment was not able to compare some service situations with the previous pre-FMS years. For example the presence and functionality of referral systems in the facilities for previous years compared to the FMS year.

## CHAPTER THREE: STUDY FINDINGS AND DISCUSSION

### 3.0 Introduction

This section provides the analysis of the three parts of the study that include:

- 3.1 The maternal services which entailed trend analysis of antenatal care attendance, PMTCT maternity services, types of delivery, maternal complications and family planning services.
- 3.2 Service availability for free maternity services. This entailed review of all the services that are available within the free maternity services framework.
- 3.3 Facility readiness to provide the free maternity services. This entailed review of level of facility readiness of to provide facility readiness across the different services which are available in the facilities.

Data that is regularly received in DHIS (MOH) on maternal services was used to analysis the trends over 3 Financial Years (FY) (2011/12 – 2013/14). Using an evaluation questionnaire, 283 health facilities (across different levels) were assessed for readiness of FMS. A total of 386 mothers who had benefitted from the FMS services were interviewed to establish their perceptions and their opinion on the quality of FMS service received.

### 3.1 Maternal Services Trend Analysis

#### 3.1.1 ANC Attendance

There was increased utilization of ANC service in the year of initiating FMS especially among ANC re-visits (13%). Pregnant mothers attending 4<sup>th</sup> ANC visits recorded 11% increase. Other services related to ANC that recorded increased utilization included; ANC clients HIV testing (6%) and ANC partner HIV testing (33%).

Table 1: Trends in ANC attendance by year

| ANC Event              | 2013/14   | 2012/13   | 2011/12   | Average Change % (From yr 2012/13 to 2013/14) | Average Change % (From yr 2011/12 to 2012/13) |
|------------------------|-----------|-----------|-----------|---|---|
| New ANC clients        | 1,234,997 | 1,169,586 | 1,144,314 | 5.59  | 7.92  |
| Re-Visit ANC Clients   | 2,212,930 | 1,956,974 | 1,936,589 | 13.08   | 14.27   |
| Clients with Hb <7g/dl | 23,596    | 23,819    | 31,351    | (0.94)  | (24.74)                                       |

| ANC Event  | 2013/14   | 2012/13   | 2011/12   | Average Change % (From yr 2012/13 to 2013/14) | Average Change % (From yr 2011/12 to 2012/13) |
|--|-----------|-----------|-----------|---|---|
| Clients given-IPT 1st Dose                       | 354,821   | 358,843   | 390,382   | (1.12)  | (9.11)  |

### 3.1.2 Maternity PMTCT

Mothers in the maternity counselled and tested for HIV increased by 12% and 11% respectively. Deliveries of HIV positive mothers increased by 10%, while infants initiated on cotrimoxazole increased by 5%.

Table 2: Trends in PMTCT services offered by year

| PMTCT Service                                       | 2013/14 | 2012/13 | 2011/12 | Average Change % (From 2012/13 to 2013/14) | Average Change % (From 2011/12 to 2012/13) |
|---|---------|---------|---------|--|--|
| Maternity Women Counselled                          | 265,232 | 236,245 | 231,419 | 12.3                                       | 14.6                                       |
| Maternity Women Tested for HIV                      | 231,977 | 209,023 | 203,926 | 11.0                                       | 13.8                                       |

### 3.1.3 Type of delivery

There was an increase in the normal deliveries and in the caesarean section deliveries at 22% and 17% respectively with live births increasing by 21% in the year FMS was introduced compared to the previous year. Neonatal deaths and maternal deaths registered increases of 27% and 10% respectively. These increments are based on absolute numbers that utilized the services. The proportion of normal deliveries between the first year of implementing FMS and the previous year remained the same (85%) and similarly the proportions of caesarean section in these years more or less remained the same at 12.3% (2013/14) and 12.7% (2012/13). Institutional maternal mortality rate changed over the years from 215/100,000 live births (2011/12) to 124/100,000 live births (2013/14).

Table 3: Trends in type of delivery, by year

| Maternal Event  | 2013/14 | 2012/13 | 2011/12 | Average Change % (From 2012/13 to 2013/14) | Average Change % (From 2011/12 to 2012/13) |

### 3.1.4 Maternal Complications

Over the years the most common complication among the deliveries was obstructed labour. There was a decline in its incidence between the years 2011/12 to 2012/13 from 3.2% to 1.6% and this decline continued into the year 2013/14 though at a slower rate to 1.3%. Among the complications reported there was a notable decline between 2011/12 and 2012/13 and thereafter there seemed to be no difference between the year of first implementing FMS and the previous year.

**Table 4: Trends in Maternal complications, by year**

| Complications  | 2013/14        | 2012/13        | 2011/12        |
|--|----------------|----------------|----------------|
| <b>Total number deliveries</b>                       | <b>847,104</b> | <b>701,486</b> | <b>328,673</b> |

### 3.1.5 Family Planning (FP)

There was a minimal (1.5%) increase of clients enrolling for use of the various FP methods over the 3 years. Between 2012/13 and 2013/14, there was a 9% increase of clients enrolling for FP use. Implants insertion method recorded the highest increase of 53% over the 3 years.

**Table 5: Trends in use of family planning methods, by year**

| Year                      | 2013/14 | 2012/13 | 2011/12 | Average Change % (From 2012/13 to 2013/14) | Average Change % (From 2011/12 to 2012/13) |

### 3.2 Service Availability for Free Maternal Services

The survey received responses from a total of 283 facilities from the 24 Counties sampled randomly, of these 3 (1.1%) facilities were private and the rest were public from levels 6 - 2. Level 6 were 2(0.7%), level 5 were 12 (4.2%), level 4 were 68 (24%), level 3 were 142 (50.2%) and level 2 were 56 (19.8). Findings from 16 key informants are also included in this analysis and discussion.

**Table 6: Services Provided by County Facilities**

| County                            | Child Health | ANC         | Maternity   | Clinical Lab | Operative   | Other Services |
|-----------------------------------|--------------|-------------|-------------|--------------|-------------|----------------|
| Bomet                             | 88.9         | 88.9        | 55.6        | 88.9         | 22.2        | 0.0            |

\* = Sampling was for only level 5 health facility in the county, \*\*=only level 4 health facilities were visited

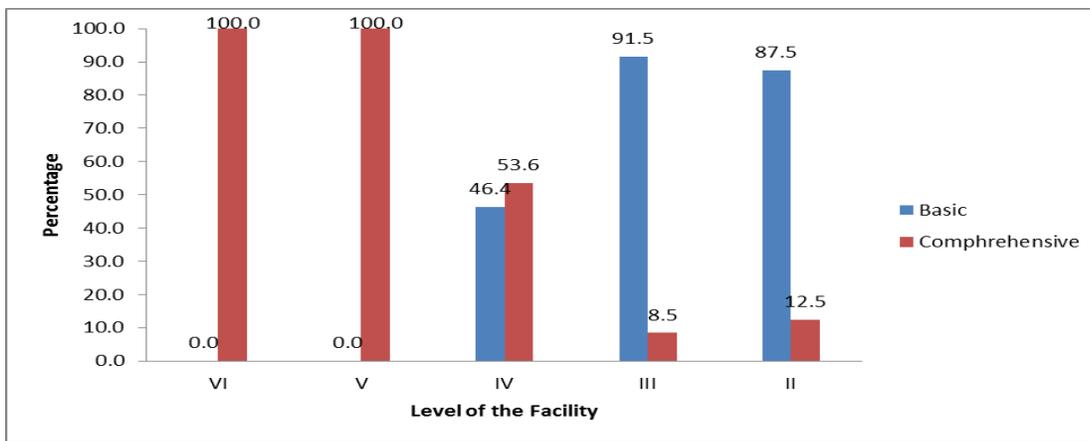

A majority of the facilities visited in the counties provided child health, ANC, Maternity and clinical laboratory services in the following proportions respectively 97.8%, 98%, 95.2% and 89.5%. About 31.6% of the facilities offered operative services, as expected most of the operative services were at the higher facility levels of 4, 5 and 6. Generally maternity services were available at all levels except in some level 2 and 3 facilities.

**Table 7: Services Provided by Level Facility**

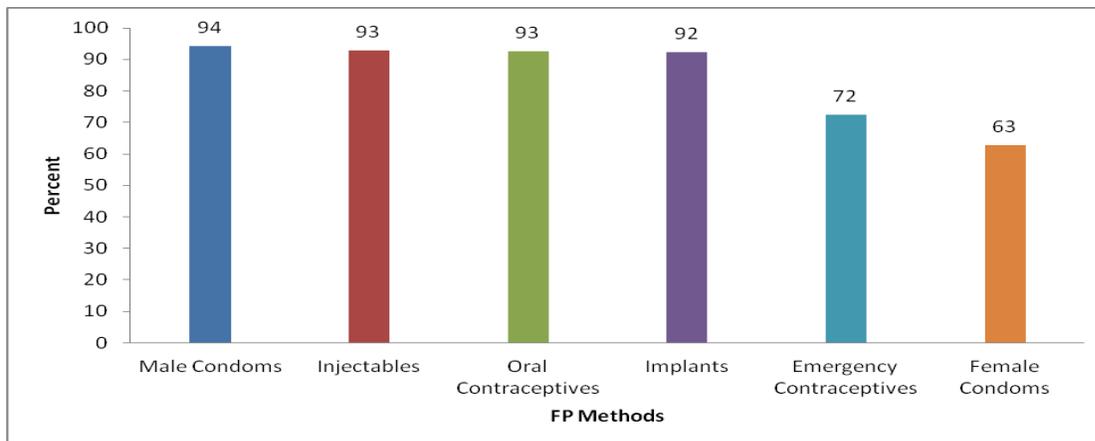

| Facility Level | Child Health | ANC   | Maternity | Clinical Lab | Operative | Other Services |
|----------------|--------------|-------|-----------|--------------|-----------|----------------|
| VI             | 100.0        | 100.0 | 100.0     | 100.0        | 100.0     | 0.0            |
| V              | 100.0        | 100.0 | 100.0     | 100.0        | 93.3      | 20.0           |
| IV             | 100.0        | 100.0 | 100.0     | 100.0        | 47.1      | 29.4           |
| III            | 97.9         | 98.6  | 96.5      | 94.4         | 9.2       | 35.9           |

*Source: Field work*

All facilities visited that had maternities offered basic obstetric care and of these 24% offered comprehensive obstetric care. All level 5 and 6 facilities offered comprehensive obstetric care, while basic obstetric care was mainly offered at the lower levels.

**Figure 1: Essential Obstetric Care provided by the facilities; *Source: Fieldwork***

**Figure 2: Family planning methods offered; *Source: Fieldwork Field work***

The various family planning methods were available in most facilities

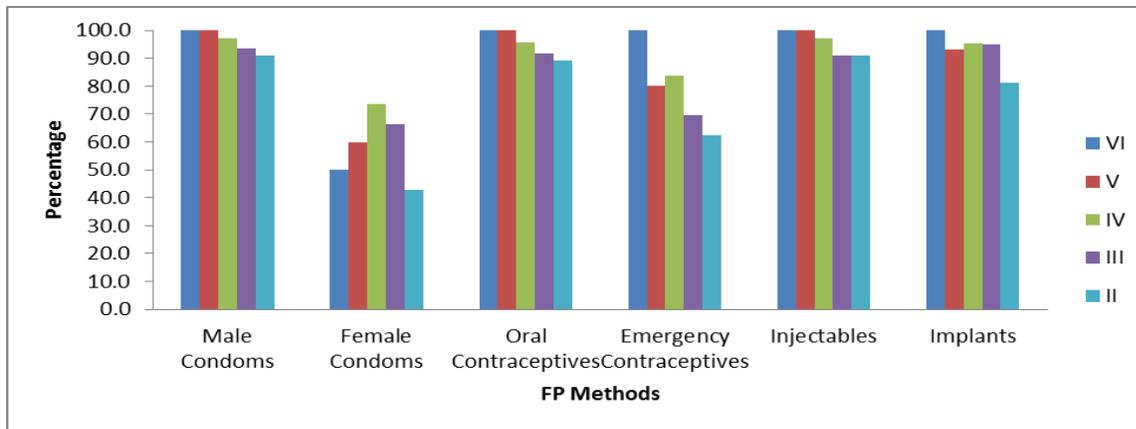

Figure 3: Family planning methods offered by facility level; *Source: Field work*

Table 8: Reproductive Health Services Provided by the Facilities

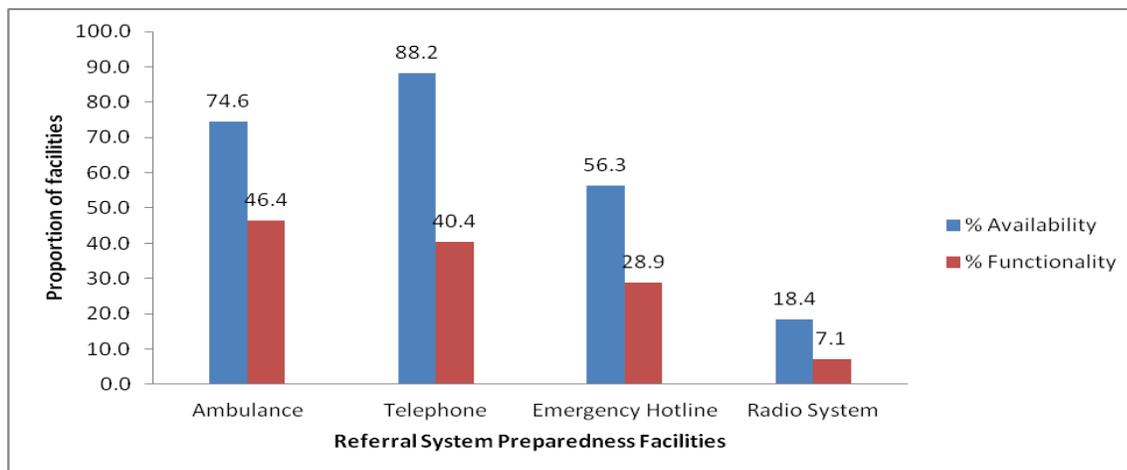

| Reproductive Health       | Percent |
|---------------------------|---------|
| Post Abortive Care        | 69      |
| Breast Cancer Screening   | 83      |
| Cervical Cancer Screening | 57      |
| Youth Friendly Service    | 25      |

*Source: Fieldwork, 2014*

The least offered reproductive service was the youth friendly service at 25%

### 3.3 Service Readiness and Quality for FMS

Figure 4: Readiness to provide referral services

*Source: Fieldwork, 2014*

Overall, 60% of the sampled facilities had referral systems in place though only a third (31%) of these systems were functional. More specifically, majority of the facilities (75%) had ambulances and

telephones (88%) for use in cases of referral, but unfortunately not more than half of either were functional.

There was reported inadequate staff in the health facilities with specialized cadres (gynaecologist, paediatricians) being the most affected, followed by the medical doctors and mid-level cadres (clinical officers, nurses) as expressed by some of the health facility key informants. A majority of staff were tasked to work in multiple departments whenever on duty especially in the lower level facilities (levels 2-4).

**Table 9: Personnel trained in reproductive health**

| Area of Training           | Proportion Trained | Average Number per Facility |
|----------------------------|--------------------|-----------------------------|
| EMONC                      | 67.5               | 3.0                         |

**Source: Fieldwork, 2014**

Majority (75%) of the health facility HCWs had received some form of reproductive health training, with an average of 4 HCWs trained per facility. Among the various reproductive health trainings offered to the health workers, PMTCT was the most commonly received by the HCWs with an average of 8.2 HCWs trained on PMTCT in each facility visited (table 4.2). About 60% of the facilities had CMEs, with 55% conducting them weekly and 35% monthly. This finding is similar to sentiments made by a key informant who indicated that “...most of our workers are qualified, we are updated with current practice, have job aids and we do receive support supervision from our partners. Professional CMEs are held every Thursday...”.

**Table 10: Personnel Trained in Reproductive Health by Facility Level**

| Facility Level | EMONC | PMTCT | PAC   | FP    | ARH   | FANC  | IMCI | VIA/VILI |
|----------------|-------|-------|-------|-------|-------|-------|------|----------|
| VI             | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 50.0 | 100.0    |

*Source: Fieldwork, 2014*

The proportion of HCWs trained in the various aspects of reproductive health was higher in the higher level health facilities compared to the lower level facilities.

### 3.3.1 ANC IEC and Reference Materials

Most ANC clinics had the basic reference materials for care (FANC guidelines; 76%); (FP guidelines; 81%).

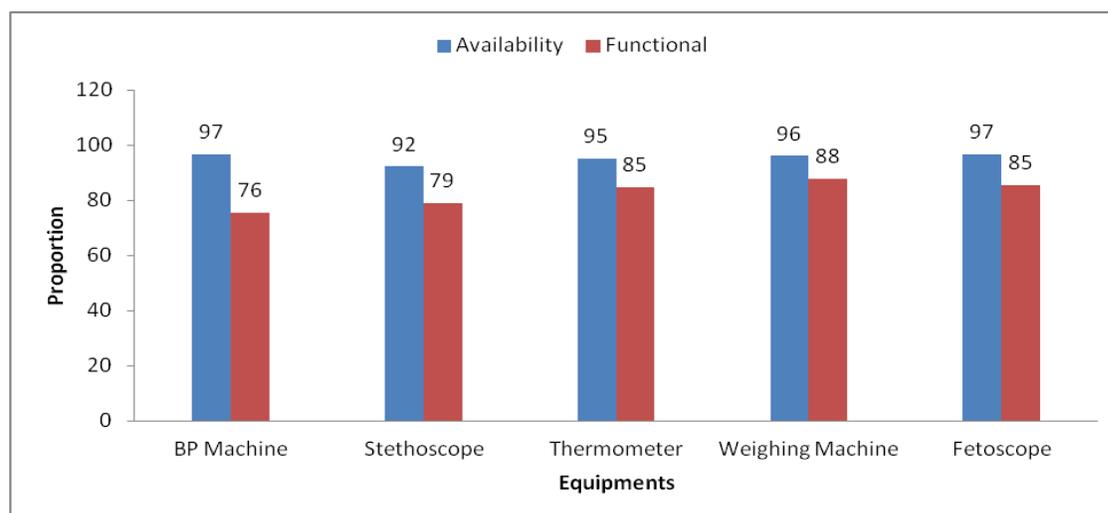

**Table 11: Waiting Time**

| Waiting Time (in Minutes)   | Mean        | Minimum    | Maximum      | Range        |
|-----------------------------|-------------|------------|--------------|--------------|
| First Client                | 22.7        | 4.0        | 127.0        | 123.0        |
| Second Client               | 20.5        | 5.0        | 180.0        | 175.0        |
| Third Client                | 23.0        | 5.0        | 180.0        | 175.0        |
| <b>Average Waiting Time</b> | <b>22.1</b> | <b>4.7</b> | <b>162.3</b> | <b>157.7</b> |

*Source: Fieldwork, 2014*

The time between arrival of mothers at the ANC clinic to when they were attended to by the HCWs was observed. Observation was done based on a sample of three clients per facility. On average 22 minutes of waiting was observed among the facilities visited (table 3.11). Of concern is waiting time of 2 hours (180 minutes). The long waiting time may be attributed to increased number of mothers attending the ANC and/or inadequate number of staff to serve the mothers. One Key informant observed that with introduction of FMS there had been an increase in utilization of services by up to 26% increase in deliveries, 22% increase in caesarean section and 50% increase in ANC visits, indicating a drastic increase of workload in that respective health facility.

Figure 5: Availability and functionality of basic equipment for ANC

Source: Fieldwork, 2014

Most facilities had the basic equipment's for ANC clinic available and functional. Non-functioning equipment was more commonly found at the lower level health facilities.

Table 12: Availability and functionality of basic equipment for ANC by facility level

| Facility Level | BP Machine   |               | Stethoscope  |               | Thermometer  |               | Weighing Machine |               | Fetoscope    |               |

| <b>National Average</b> | <b>84.6</b>  | <b>7</b>  | <b>19.8</b>               |

Source: Fieldwork, 2014

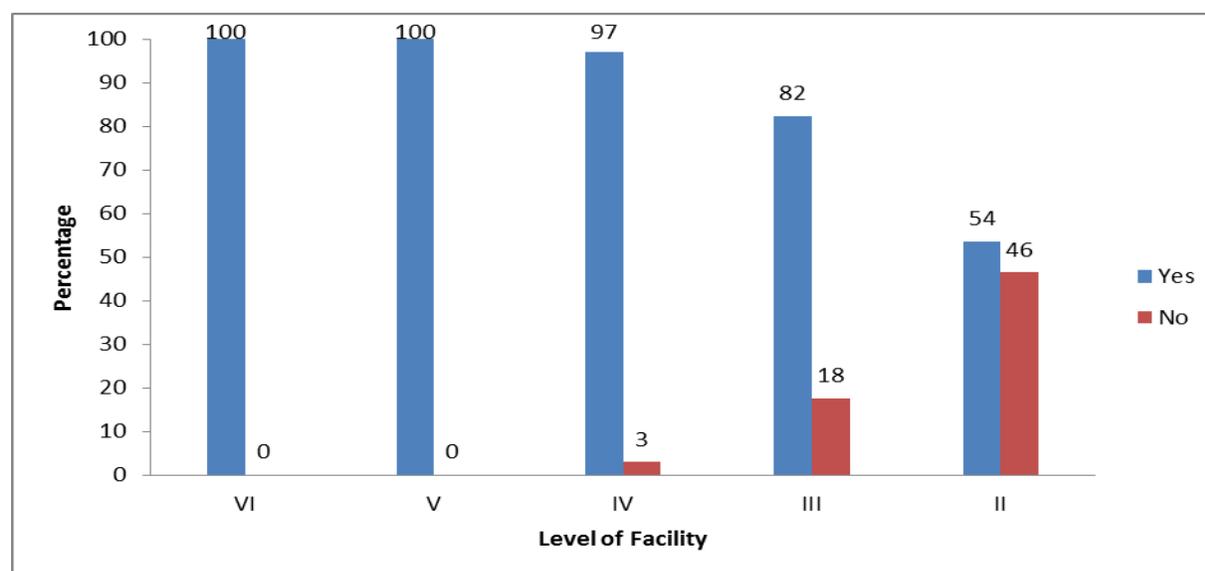

Most essential commodities for ANC were available except malaria prophylaxis drugs only being available in 46% of the facilities at the time of visit. N/b Stock outs of the malaria prophylaxis drugs were mainly

reported, in some malaria non-endemic counties e.g. Nairobi, Kajiado, Machakos. Key informants reported that generally the essential commodities for the ANC were available and that they easily receive them from KEMSA on request.

### 3.3.2 Maternity Care

Twenty four (24) hours Maternity in-patient services were offered by 82% of the facilities. As would be expected most of the facilities that did not offer 24 hour maternity in patient services were level 2 facilities.

Figure 6: Service provision for 24 hours

Source: Fieldwork, 2014

Delivery guidelines and job aids for reference were available within the maternity units that were visited as demonstrated in table 14 below.

Table 14: Delivery Guidelines and Job Aids available in the Maternity units.

| Delivery Service Guidelines | Percent |
|-----------------------------|---------|
| EMONC                       | 56.5    |
| FANC                        | 67.5    |
| FP                          | 64.3    |
| Community mid-wifery        | 27.9    |
| IMCI                        | 54.8    |
| IPC                         | 53.0    |
| <b>Job Aids</b>             |         |
| New born Resuscitation      | 62.2    |

|                        |      |
|------------------------|------|
| Immediate newborn care | 61.8 |
| Warm Chain Chart       | 46.6 |
| AMTSL                  | 68.9 |
| Kangaroo Mother Care   | 49.8 |
| Vacuum Delivery        | 34.3 |
| MgSO4 Administration   | 65.7 |

*Source: Fieldwork, 2014*

### 3.3.3 Essential Amenities

Essential amenities for the mothers in the facilities were assessed. It was established that toilets were available in 87% of the total facilities; bathrooms were found in 79% and evidence of running water found in 64%. Of these 69% of the toilets and 62% of bathrooms were functional.

Availability of beds in the maternity ward was reported by 89% of the facilities. Incidences of mothers sharing beds within the maternity wards were evident in 18% of the facilities and key informants provided the same information. Baby cots were available in 54% of the facilities.

A maternity in-charge said *“space is inadequate, when women share beds, there is no privacy. The linen may be adequate but it could be better, we have only one resuscitator yet so many babies are born every day. Sometimes examination lights are not functioning. There is no ventilator in the maternity so very sick patients are sent to ICU”*

These sentiments revealed compromised functionality and inadequacy of essential amenities and equipment’s in some maternities.

**Table 15: New Born Essential Commodities**

| <b>Essential New Born Commodities</b>   | <b>Percent</b> |
|---|----------------|
| Firm Surface for New-born Resuscitation | 63             |
| Incubator                               | 47             |
| Other Functional Heat Source            | 68             |
| Working bags valve                      | 71             |
| Working Suction Equipment               | 72             |
| Disposable cord tie/clamp               | 75             |
| Towels/Blanket to wrap the baby         | 31             |
| High flow of Oxygen source              | 63             |

*Source: Fieldwork, 2014*

Only 22% of the facilities had new born units. At least 63% of the facilities had firm surface for new born resuscitation while 72% had functional suction equipment and 63% had high flow oxygen source.

**Table 16: Delivery Essentials**

| Delivery Essentials      | Percent |
|--------------------------|---------|
| Delivery Pack            | 90      |
| Episiotomy Set           | 77      |
| Vacuum Extractor         | 40      |
| Manual Vacuum Aspiration | 58      |
| Surgical Sutures         | 78      |

*Source: Fieldwork, 2014*

A majority (90%) of the facilities had delivery packs, 77% had episiotomy sets and 78% had surgical sutures and the essentials became less available at the lower facility levels as capacity of function also decreases.

**Table 17: Delivery Essentials by Facility Level**

| Facility Level | Delivery Pack | Episiotomy Set | Vacuum Extractor | Manual Vacuum Aspiration | Surgical Sutures |
|----------------|---------------|----------------|------------------|--------------------------|------------------|
| VI             | 100.0         | 100.0          | 100.0            | 100.0                    | 100.0            |
| V              | 100.0         | 92.9           | 80.0             | 86.7                     | 100.0            |
| IV             | 95.6          | 78.3           | 55.9             | 77.9                     | 83.8             |
| III            | 93.7          | 75.6           | 35.2             | 57.7                     | 76.8             |
| II             | 71.4          | 72.5           | 17.9             | 26.8                     | 66.1             |

*Source: Fieldwork, 2014*

Of the facilities visited 77% had a room (space) that was defined as an operating theatre. The table below gives a profile of the available theatres.

**Table 18: Profile of the available operating theatres**

| Delivery Apparatus  | Availability, (%) | Functionality, (%) |
|---|-------------------|--------------------|
| Operating Table   | 28                | 81                 |
| Operating Light   | 26                | 72                 |
| Anaesthesia giving set                                    | 28                | 69                 |
| Scrub Area Adjacent to or in operating room               | 26                | 74                 |
| Tray/Drum/package with sterilized instruments             | 25                | -                  |
| Halothane or Ketamine                                     | 15                | -                  |
| Presence of HCW who can perform C/S or on call 24 hrs/day | 21                | -                  |
| Presence of Anaesthetist or on call 24 hrs/day            | 14                | -                  |

*Source: Fieldwork, 2014*

Availability of privacy in the maternity units was reported in 67% of the facilities and 84% at least had a delivery bed.

### 3.3. 4 Partographs

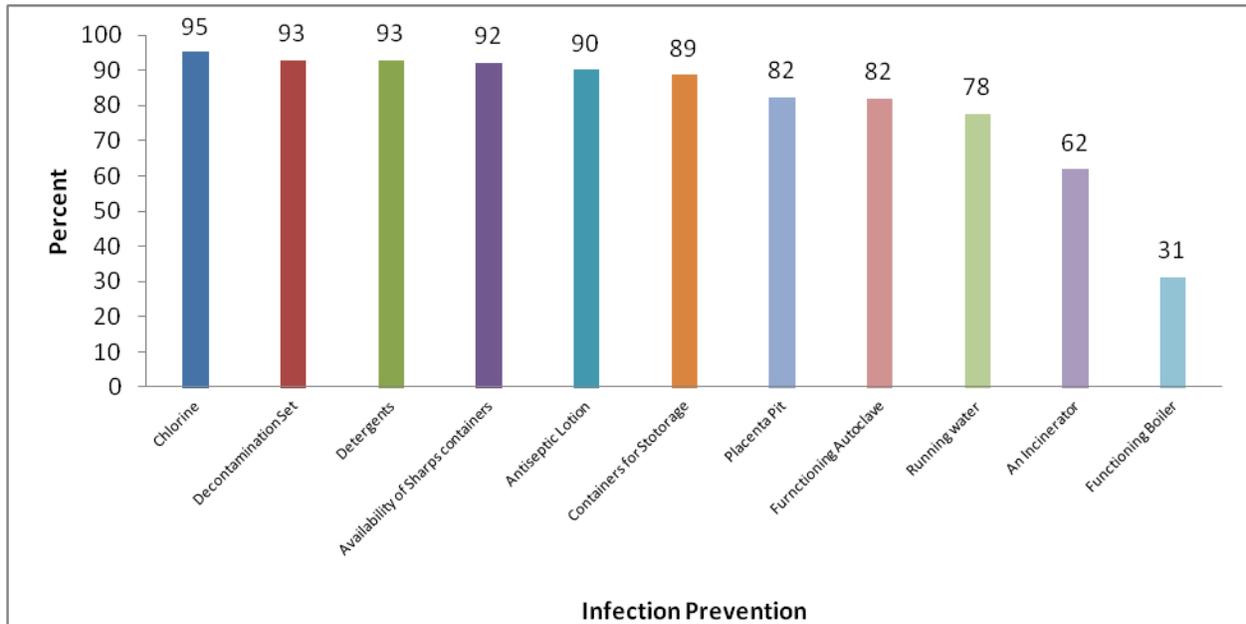

Among the facilities visited 73% reported availability of partographs with 82% utilizing them for monitoring labour.

Table 19: Documentation of Partographs and Post natal Information

| Information                    | Percent |
|--------------------------------|---------|
| <b>Partograph</b>              |         |
| Mother's Biodata               | 48      |
| Fetal Condition                | 44      |
| Progress of Labor              | 42      |
| Maternal Condition             | 39      |
| Birth Information              | 43      |
| <b>Post natal ward records</b> |         |
| Baby Examination               | 34      |
| Postnatal Mother examination   | 36      |

The study evaluated the extent to which documentation was done by sampling 3 patient files from the labour ward and another 3 from the post natal ward. It was noted that patient information was not adequately documented with post natal records being the most affected.

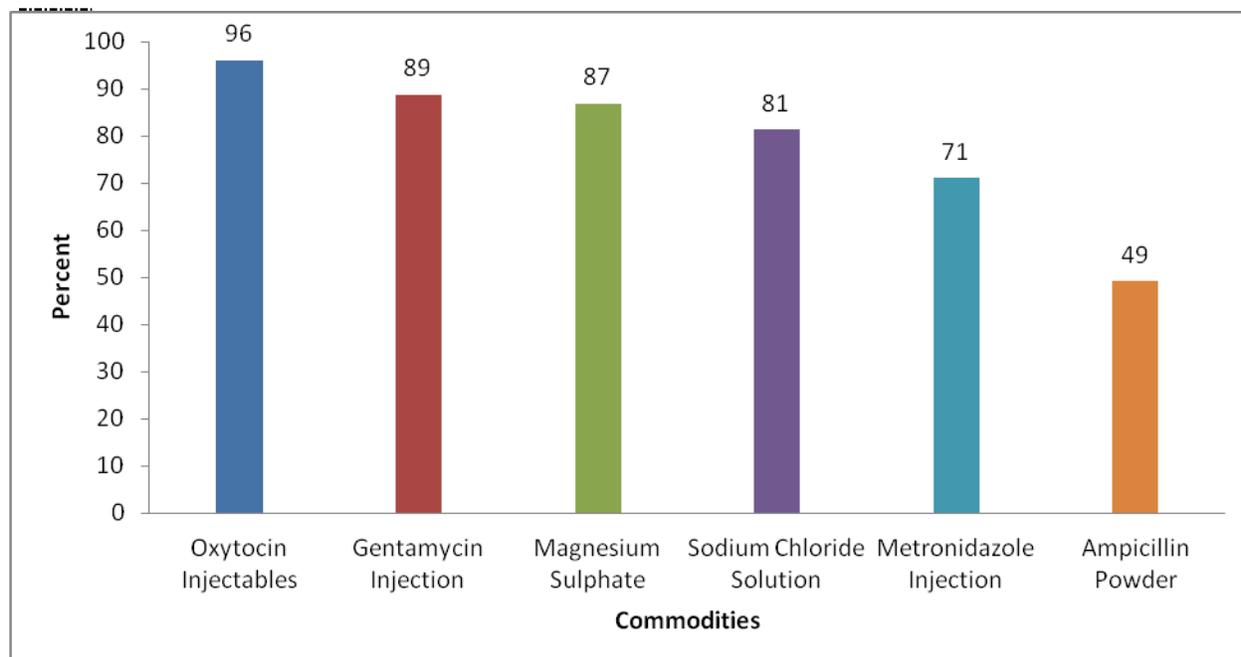

Figure 7: Availability of Infection Prevention Materials / equipment

Source: Fieldwork, 2014

Materials and equipment for infection control were generally available in most facilities. However this survey did not determine the extent of infection control practice.

Figure 8: Availability of essential commodities in the maternity

Source: Fieldwork, 2014

A majority (96%) of the facilities, 89% of facilities and 87% of facilities visited had Oxytocin injection, Gentamycin injection and Magnesium sulphate available respectively. The commodity most affected with stock outs was Ampicillin with 11% of facilities reporting it's out of stock in the one month preceding the survey.

Table 20: Maternal deaths and audits in the last 12 months, by county

| County   | Total No. of Maternal Deaths | Total No. of Maternal Audits |
|----------|------------------------------|------------------------------|
| Machakos | 34                           | 20                           |
| Kakamega | 32                           | 0                            |
| Kisii    | 30                           | 8                            |
| Kisumu   | 26                           | 7                            |
| Nairobi  | 26                           | 7                            |
| Garissa  | 24                           | 16                           |
| Kajiado  | 22                           | 0                            |

| <b>National</b> | <b>301</b>                   | <b>132</b>                   |

\*= cumulative back log of maternal audits

Source: Fieldwork, 2014

There were a total of 301 maternal deaths that occurred in the 12 months preceding the survey in the county health facilities that were visited. Over the past 1 year a total of 132 maternal audits were undertaken. Some counties however did not have evidence of maternal death audit e.g. Kakamega, Kajiado) despite having recorded some maternal deaths.

Table 21: Availability of registers in the facilities

| Register           | Percent |
|--------------------|---------|
| ANC Register       | 89      |
| Maternity Register | 88      |
| PNC Register       | 91      |

Source: Fieldwork, 2014

Among the health facilities visited the basic registers for recording and reporting were available as demonstrated. Monthly summary reports were available in 89% of facilities.

### 3.3.5 Supervision

Eighty seven percent (87%) of the facilities reported that they had received support supervision in the 3 months preceding the survey. Most of the facilities (79%) reported being supervised by the County Government, while supervision by the National Government was reported by only 2% of the facilities. National key informants said that with devolution, conducting supervision in counties had become challenging, one said “we have had only one single supervision session after devolution. Supervision should be at least quarterly and should not be seen as policing but as engaging. This is fundamental”.

### 3.4 Key Informants' Perceptions of FMS Programme

In-depth interviews were conducted among key informants both at the National and County levels. At the National level discussions were held with key informants from various departments within the MOH, including the office of Director of Medical Services, the 4 Directorates (Policy Planning and Health Care Finance, Standards and Regulatory Services, Preventive and Promotive health services and Clinical services), the Health care Financing Unit, Reproductive Health Unit, Intergovernmental Liaison Unit, Division of Health Information System unit. One representative of a health development partners was also interviewed. In total 9 key informant discussions were held at national level. The scope of discussion at the national levels covered various themes including, the role of the various departments in the FMS initiative including its inception, implementation and monitoring, the scope of the initiative, reimbursement, the quality of care, the coordinating mechanism of the programme, challenges and possible solutions.

At the County level, the key informants included County Chief Executive officer (CECs) for Health, County Health Directors and Maternity-in-charges. In addition to the themes discussed at the national level, there was a focus of discussion on service availability, readiness for FMS and the quality of care at this level. A total of 16 key informants participated in discussions at county level.

#### (a). Noble Idea

There were a number of key informants especially from the National level who were involved in the inception planning of the FMS programme idea. The FMS idea was initiated before the 2 Ministries (Public Health and Sanitation and that of Medical Services) were merged with the purpose of being “*a strategy to enhance maternal service access to the poor*” a key informant provided these sentiments. A majority of the informants both from the national and county levels felt that the FMS program was a noble idea, with some giving various expressions “*This is a worthwhile program. We need to strengthen the coordination mechanism. It requires continuous monitoring of service delivery to maintain quality*”, “*this is a good idea, it increases access to mothers*”, “*FMS is a noble idea. It is an opportunity to give our mothers quality care*”. Comments from the community on the idea included “*for mothers who could not afford, this is really a benefit*”, “*the government should continue with this offer*”, “*we are thankful to the government*”, “*this is a saving to many families*”. The sentiments indicate that the idea of FMS is generally acceptable and well appreciated by the community.

## **(b). Scope of FMS**

The survey sought to find out who is involved in the coordination of the FMS program, key informants felt its' implementation is mainly overseen by the Ministry of Health (MOH) alone. One informant said “ *On initiating FMS implementation, the (MOH) put together a team under the DMS (Director Medical Services) to oversee the FMS programme, basically a MOH team was purposed to have technical and finance experts*” and another said “*FMS was designed at the technical level at the MOH and RH unit and did not involve the Reproductive Health Inter-country coordinating Committee (RHICC) which could improve function of the program, the FMS policy development is ongoing right now and is more inclusive*”.

There was communication from the MOH as per the circular dated 1<sup>st</sup> April 2014, that FMS programme covers the following services; ANC, Deliveries, PNC and complications of delivery including; ICU care, renal dialysis, and complicated medical diseases in pregnancy. The communication also informed that facilities would be reimbursed Kshs 2,500 and Kshs 5,000 for health centres/dispensaries and hospitals respectively based on performance (number of deliveries conducted). Despite the availability of this circular which was circulated long after start of FMS implementation, sentiments from key informants indicated that they were not clear as to what these funds cater for, one said “ *it is not clear what these funds cover, is it only delivery? What about ANC and PNC*”. Key informants raised concern over the scope of FMS in terms of the conditions it takes care of. One said “*Conditions related to pregnancy including; ectopic pregnancy, early pregnancy bleeding and issues related to new born care need to be considered in this programme for better maternal and child outcomes*” and another said “ *preterm babies have increased, nobody takes care of this*”

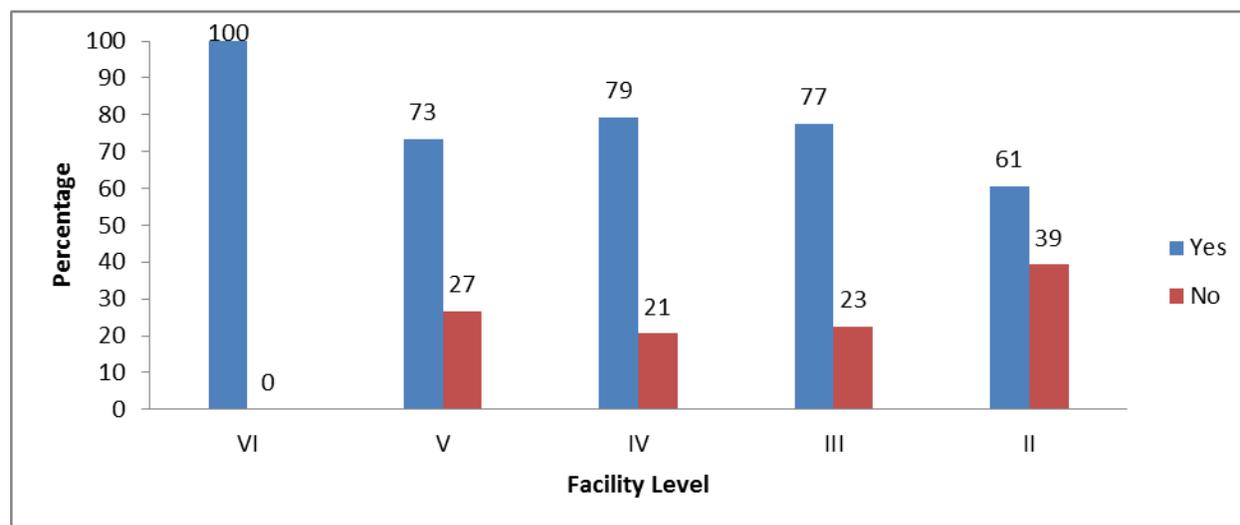

## **(c). Reimbursement of Funds**

Various key informants reported on some of the factors that were considered in costing reimbursement for each delivery which included sentiments such as “ *it was assumed that an estimate of 15% of deliveries become complicated, that at health centre/dispensary level there would be no complications thus a reimbursement of Kshs 2500 for a delivery and not Kshs 5000 as in the higher level facilities, that women spend not more than 24 hours at the facility on delivery and that the costing is mainly based on delivery charges without including ANC and PNC*”.

The MOH decided to use the existing health financing schemes Health Sector Service Fund (HSSF) for health centres/dispensaries and the Hospital Management Service Fund (HMSF) for hospitals to reimburse

facilities providing FMS. Key informants reported that, after devolution some health facilities closed the HSSF accounts, and hence the FMS funds were channeled through central county revenue accounts. This had made facilities to have no control of the FMS funds and some facilities were not informed at all on their reimbursements. In otherwise situations where the funds were received directly into facility accounts, key informants informed of the benefits with these expressions *“a facility usually proposes on how to use the funds for maternal services and if acceptable this is approved by the AIE holder”*, *“ facilities receiving HSSF are better off, because they can plan for this money”*.

Figure 9: FMS reimbursement status by facility level

Source: Fieldwork, 2014

At the time of the survey 74% of the facilities reported that they had received reimbursement from the FMS programme within the 6 months of January to June 2014. All of the referral hospitals had received their reimbursements. Twenty five percent (25%) of facilities reported having missed reimbursements. Reasons for no reimbursement included: no feedback 8%, reimbursement reports not prepared, inaccurate reports, inactive health facility bank accounts and other administrative issues. A key informant said *“monthly reports for reimbursement have been provided regularly to the national office, but we have not received reimbursement for the last 4-5 months. The last reimbursement was in April 2014”*.

Despite the provided reimbursement, key informants in the implementing institutions had complaints on the reimbursement; *“we have incurred financial loss of millions of shillings (>100 million)”* a referral hospital that had to cope with the increased number of referrals and complications reported. These facilities felt that they are under compensated and they had complained about this to the MOH. Workload had increased because of increased utilization of the service; for example a National referral

hospital reported a 26% increase of deliveries, 22% increase of Caesarean section and 50% increase of ANC attendance yet staffing was inadequate (1 nurse taking care of 15 patients). An approval by MOH to provide staffing had never been implemented, they reported. The hospital relied on post graduate doctors who were not compensated to do the work and in addition, part time nurses were hired to mitigate the overwhelming work. Two referral hospitals reported that maternal mortality had increased because there was a tendency to focus more time on the complicated referral cases, *“jeopardizing the care for the booked uncomplicated patients”* a key informant reported. This is because of delay in providing care to the booked patients.

Key informants had suggestions on the use of the FMS funds disbursed; *“facilities should be able to invest the monies earned from this service to maintain quality and standards”*, *“FMS funds should be directly used to improve the quality of care in the ANC and maternity”*

Issues related to financial sustainability were mentioned by key informants and some suggested the consideration of using other existing health financing mechanisms e.g. National Hospital Insurance Fund (NHIF), Output Based Approaches (OBA). They also expressed a need for an audit of the whole programme to evaluate the cost effectiveness.

### 3.5 Clients' Perception on FMS

#### 3.5.1 Introduction

A total of 386 post-partum mothers who had delivered at the health care facilities visited were interviewed to seek their opinion on quality of service of the FMS programme.

**Table 22: Characteristics of the Clients and time taken to reach health facilities**

| Client Characteristic                  | Freq. | % (N = 386) | Mean (Range)    |
|--|-------|-------------|-----------------|
| <b>Age</b>                             |       |             |                 |
| 15 - 19                                | 58    | 15.0        |                 |
| 20 - 24                                | 126   | 32.6        |                 |

| 30 - 34                                | 63    | 16.3        |                 |
| 35 - 39                                | 27    | 7.0         |                 |
| 40 - 44                                | 4     | 1.0         |                 |
| <b>Parity</b>                          |       |             |                 |
| Zero                                   | 8     | 2.1         |                 |
| 1 – 3                                  | 308   | 79.8        |                 |
| 4 – 6                                  | 70    | 18.1        |                 |
| 7+                                     | 0     | 0.0         |                 |
| <b>Education</b>                       |       |             |                 |
| No Formal Education                    | 44    | 11.4        |                 |
| Primary Level                          | 163   | 42.2        |                 |
| Secondary Level                        | 142   | 36.8        |                 |
| Tertiary                               | 37    | 9.6         |                 |
| <b>Time on Foot (Minutes)</b>          |       |             | 48.7 (2 to 360) |
| <b>Time taken by Vehicle (Minutes)</b> |       |             | 37.3 (3 - 180)  |

The mean age of the mothers interviewed was 25 years (SD 6). The age category 20-24 made up the highest proportion (32.6%) compared to the rest of the age categories. A majority (80%) of the mothers were of parity 1-3. About 42% had primary level as their highest level of education while 37% had secondary level education. The mothers reported that the average time taken from home to the health facility on foot was 49 minutes while the average time by vehicle was 37 minutes.

### 3.5.2 Client Perceptions on FMS

Mothers who had benefitted from FMS were interviewed in the post-natal wards to assess their perception on the quality of care they had received in the maternity through the FMS program. Various dimensions of health facility, health care delivery and Interpersonal aspects of health staff were assessed to determine the opinion of the mothers as indicated in the table 2. For each item in the questionnaire, respondents would respond to one of the three options: agreeable (+1), Don't Know (0), or Disagreeable (-1).

**Table 23: Rating of Different Aspects of Service by the Clients**

| FMS  | Ranking of the FMS |             |
|--|--------------------|-------------|
|  | Mean               | STD         |
| <b>Health Facility</b>   |                    |             |
| Adequate Staff   | 0.09               | 0.99        |
| Well Suited to treat Women   | 0.88               | 0.46        |
| Adequacy of Rooms  | 0.12               | 0.99        |

**Table 24: Descriptive statistics and Total Perceived Quality Score**

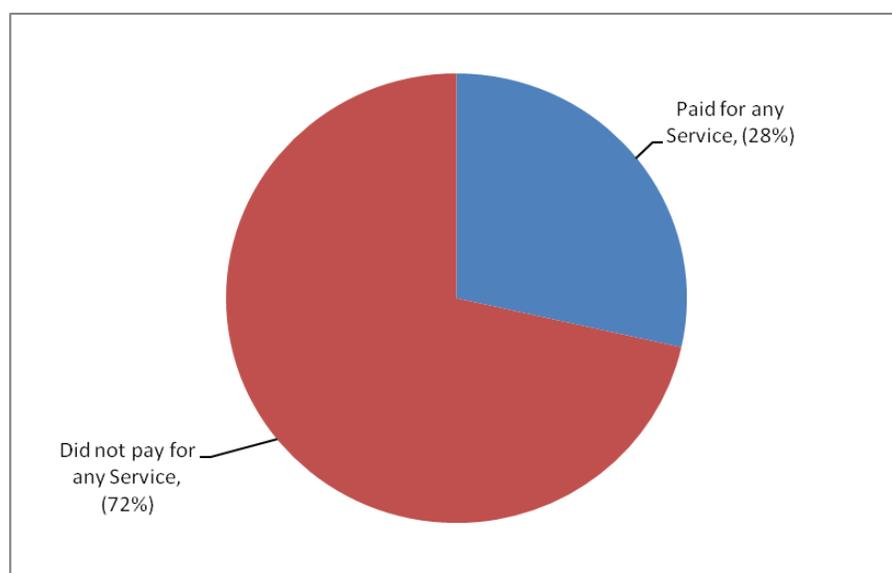

|                         | Health Facility | Health Care Delivery | Interpersonal Aspects of Health Staff | Total Score |
|-------------------------|-----------------|----------------------|---------------------------------------|-------------|
| Number of Items         | 10              | 8                    | 5                                     | 23          |
| Possible range of Score | -10 to +10      | -8 to +8             | - 5 to +5                             | -23 to +23  |
| Mean                    | 0.40            | 0.55                 | 0.80                                  | 0.58        |
| SD                      | 0.83            | 0.70                 | 0.56                                  | 0.73        |

*Source: Fieldwork, 2014*

The overall rating of the FMS services by the clients who had benefitted was 0.58 out of a possible score of 1, with the lowest rating of 0.40 for health facility aspects and 0.55 for health care delivery. The best services rated were the interpersonal skills of the health staff (0.80). The least satisfaction levels were found in the number of staff (0.09), adequacy of rooms (0.12) and distance to facility (-0.23). As much as assessment of quality of care by clients is subjective, it can still provide useful input to help the provider understand and establish acceptable standards of services. These findings should contribute to the improvement of the FMS program.

Although FMS services were free, a third (28%) of the clients reported to have paid some fee for various services that ranged from laboratory tests, drugs, ANC booklet and registration, x-ray services and delivery charges.

**Figure 10: Clients reporting having made any payment for expected maternity services**

### 3.5.3 Community Perceptions of FMS

There were various Focus Group Discussions (FGDs) conducted among community members within the catchment areas of the sampled facilities. Some of the views derived from the discussions were guided by the following themes.

#### *(a). Understanding of FMS*

Most of the community members were aware of the FMS programme which they had heard of from the media and also from mothers who had benefitted. A majority of the community members understood the FMS program as “no fee for delivery” others said “*clinic, medication and delivery are free*”, “*I am not sure if you have a caesarean section whether it will be free*”. All these sentiments indicate that it may not be very clear within the community what the scope of FMS is, there is need to reinforce on specific messaging to the community on the scope and benefit of FMS program.

#### *(b). Changes seen with FMS*

Various expressions of change were revealed by the community “*for mothers who could not afford, this is a really benefit*”, “*beddings are clean, there is warm water and food is good*”, “*the staff listen to us*”, “*the toilets are clean*”, “*there are less abortions now*”, “*the beds are not enough*”, “*the staff are not enough*”. These sentiments indicate that through the FMS program the burden of maternal care was off lifted from many families. In addition there is noted improvement of care in some facilities, while there is need for provision of better services in others.

#### *(c). How FMS can be further improved to benefit clients*

Sentiments on how best the FMS program could improve were provided by the community, this included; “*at the periphery there is inadequate staff, equipment and medicine. We would rather use the regional hospital because there is better service, but the challenge we get, is that we have to pay for fuel for the ambulance, why not provide everything to the lowest level*”. The community members suggested improvement of quality of service on various aspects including the provision of adequate staff, more space in maternities, provision of functioning theatres and ambulances among other components of the health system structure. This indicates that as much as there was opportunity to utilise the FMS, there was great need to improve on functionality for improved quality of care. Other suggestive sentiments were “*the FMS package should include towels, nappies and a few clothing for the babies*”, “*all other services should be made free*”. This indicates that there may be a need to redefine the scope of FMS to include other services and supplies related to deliveries.

There was general acceptance of the FMS program from the community when many expressed their appreciation of the service, they said “*we appreciate this offer*”, “*thanks to the government*”, “*this offer should continue*”. This indicates that the program is a worthwhile service that is needed by the community.

## 4.0 Discussion

After the introduction of the FMS there was increased utilization of services evidenced by the increased proportions of normal deliveries (22%) and the caesarean sections (17%) during the first year of implementation. Complications related to maternal care declined slightly from 4.3% (2012/13) to 3.8% (2013/14) with the biggest notable decline in obstructed labour, while the rate of the other complications (APH,PPH) remained the same as the previous year of implementing FMS. These findings may indicate that primary health workers were more able to detect signs of impending obstructed labour much earlier than was in the previous years and thus providing appropriate service actively to avoid obstructed labour. However the management of APH and PPH may not have been satisfactory. Reasons that may have led to this include inadequate staffing despite the increased workload and minimal mentorship for staff as reported by key informants. As much as demand of service is evidenced by these findings, there is need to ensure the service meets the recommended standards and quality. The Ministry and other stakeholder need to ensure that they put in place the required inputs so as to address the high service demand and balance this with the required standards.

Despite increased availability of service, functionality of various amenities and equipment for maternal and neonatal care was found wanting especially at the lower level health facilities. For instance about 50% of the available ambulances were not functioning at the time of the survey, basic amenities; toilets and bathrooms were not in use and not all facilities had running water in the maternities. Clients who had benefitted from the FMS expressed their dissatisfaction with the health facility amenities and rated it lowest at 0.40 out of a maximum 1 point compared to the interpersonal skills of staff that they rated at 0.80. These inadequacies affect the quality of care.

The FMS scope in terms of coverage of service may need to be redefined. Key informants had different understandings of what the FMS program should offer despite the circular of April 2014 from the Ministry of Health which stated clearly that the program would only reimburse for services related to deliveries and any complications related to the deliveries. Many key informants felt the scope of FMS was not adequate and conditions related to early pregnancy and new born care should be included. The different perceptions of the scope of FMS indicate the need for proper definition of the scope of FMS towards provision of holistic care for better outcomes.

There were reimbursement processes that were reported to be inefficient including the timeliness and the coordination mechanism from the National to the county levels and vice versa. These need to be

streamlined. It was also not clear from the implementers in the counties as to exactly what the funds from FMS were to be utilized for though various key informants suggested that these funds should be re-invested into maternal care. In line with proposed scope of FMS to include more service as suggested by various stakeholders, the funds to reimburse will need to be reviewed to be inclusive of all the changes made. The complex issues of reimbursement may require the re-organisation of the disbursement model in agreement and in consultation with the Counties. As noted from the implementing key informants, maternal care was expressed as linked to other services that exist within the health facilities so that it is difficult to cost this care as only maternal care as it impinges on other services especially in situations of complications. Possibly the reimbursement could be based on agreed on FMS indicator targets for counties and payment of FMS funds would be in the form of increasing the health funding to the counties rather than re-imbursing as the FMS project singly. The counties would then decide how to re-invest these funds to improve maternal care.

The FMS was noted to be a worthwhile program which requires a coordinated mechanism that needs to be strengthened and streamlined. This includes effective communication and continuous monitoring of service delivery. Apart from availing the services within the FMS programme, all elements of health systems strengthening should be on check to maintain quality of care. This may require the engagement of various stakeholders (reproductive health, finance, community resource persons) to be tasked to oversee the implementation and monitoring of the program.

## CHAPTER FIVE: CONCLUSIONS AND RECOMMENDATIONS

### 5.1 CONCLUSIONS

The free maternity program was directly targeted at addressing a clear need for health that clients have expressed. It has helped to reduce the barriers to maternity services that many persons in Kenya were facing. As it is, there are already a number of mothers who are benefiting from it. However, the program is still faced with a number of operationalization challenges, which form the basis of the recommendations arising from this assessment.

- i) The higher utilization suggests a real demand for services has been increased, arising from the reduction in the financial barriers to accessing maternal health services
- ii) The varied trends in utilization across many different maternal health services, together with the responses from Key Informants, and from the Focus Group discussions suggest lack of clarity about the scope of interventions included as part of the Free Maternity Services
- iii) The high utilization without coherent evidence of increased investments to cater for this (more infrastructure, staff, commodities) suggest reduced quality of service delivery due to less available investments
- iv) The Key Informants and FGD responses on health workforce productivity and quality of care plus no evidence of improvements in readiness to provide maternity services suggest reductions in quality of care (reducing client experiences, little evidence of better patient safety measures and of assuring / monitoring adherence to expected care standards)
- v) The weak guidance on the use of the refunds as reported by Key Informants, plus their virtualization based on deliveries suggest poor targeting of the reimbursements and therefore inefficiencies may arise in the use of the refunds to improve maternity services

### 5.2 RECOMMENDATIONS

Overall, this is a policy direction that needs to be more entrenched into the service delivery to address the health needs of the country. The key areas the sector needs to prioritize relate to the following:

- At the policy level, the Government needs to urgently formulate a clear, and coherent policy guideline for operationalization of the Free Maternity Services across the country. This needs to focus on the intent of the FMS, together with key issues that will need to be implemented and monitored to assure the achievement of this intent.
- At the strategic level, the Government needs to:

- Define succinctly the set of interventions that make up the free maternity services. It is recommended that these relate to all the interventions that directly / indirectly influence delivery outcomes to ensure the FMS approach is able to achieve its goals. These include the ANC services, delivery, post natal services (including care for the newborn / infant)
- Integrate the FMS policy guidelines into the overall efforts to reduce financial barriers to accessing health services, to ensure it is institutionalized into the overall financing strategy for health.
- Define a more comprehensive, institutionalized system for financing the FMS that builds on the country efforts to improve equity in financing – especially exploring the scope for social health insurance mechanisms.
- At the operational level, the sector need to focus on the following:
  - Put in place clear strategies that national and county governments need to jointly assess, map and plan investments to improve quality of service delivery for FMS through prioritising investments in Human Resource, infrastructure and commodities based on the anticipated demand for FMS. These should be at facility level, aggregated to county and national levels
  - Define the strategies that counties need to assess, map and plan for investments needed to improve readiness to provide FMS by facilities through prioritising skills building, equipment availability (including water/electricity), and other facilitator investments needed to provide the services
  - Provide Standard Operating Procedures (SOPs) to guide facilities on key actions they need take and monitor to improve client experiences, patient safety, and ensure adherence to care standards to improve on the quality of care provided for FMS clients
  - Define a more independent, and real time system for capturing information relating to the agreed FMS that would provide transparent information on service provision outputs and capacities. County-wide Electronic Health Records Systems need to be scaled up to facilitate this.

## ANNEXES

## ANNEX 1: SAMPLED REGIONS

| Region            | County  | Random Sample | No. of County | Weight 1 | No. Facilities |

## ANNEX 3: CLIENT – PERCEIVED QUALITY OF MATERNITY SERVICES

### MINISTRY OF HEALTH

#### AN ASSESSMENT OF THE FREE MATERNITY SERVICES (FMS) PROGRAMME

#### CLIENT-PERCEIVED QUALITY OF MATERNITY SERVICES

#### INTRODUCTIONS

- I am here today working on a project that will be assessing the effects of implementing the FMS programme by the Ministry of Health.
  - We are collecting information from mothers who have benefitted from the FMS service to understand their rating of the services they received.
  - This information will be gathered by asking you some questions related to the service you received

**Purpose:** The information collected will be used to describe the level of satisfaction that mothers have related to this service and thus inform on areas that require service improvement for effective and efficient FMS implementation.

**Data Source:**

**Inclusion Criteria:**

- Postpartum women who have delivered in a health care facility. (anytime between day 0-42). May be recruited from the post-natal ward or post-natal/child welfare clinic.

**Exclusion criteria:**

- Women who delivered at home.
- Women who delivered on the way to a facility.
- Women who had stillbirths.
- Women with early neonatal deaths.

**Informed Consent (verbal):**

Are you willing to participate in a short interview with me of about 20 minutes, in which I will ask you about the maternity services you received. The questions asked will be about your thoughts and opinions on these issues. There are no right or wrong answers. Your responses will remain anonymous.

Your participation is completely voluntary. You may choose to stop answering at any point. Your participation, and the answers you provide, will not impact on your care at this hospital in any way.

Date:                    \_\_\_ / \_\_\_ / \_\_\_\_\_ (DD-MM-YYYY)  
County:                    \_\_\_\_\_  
Sub-county:                    \_\_\_\_\_  
Facility Name:                    \_\_\_\_\_  
Enumerator's Name \_\_\_\_\_  
Client Number:                    \_\_\_\_\_

**SECTION A: GENERAL INFORMATION**

1. Age (years):                    \_\_\_\_\_
2. Parity:                    \_\_\_\_\_ + \_\_\_\_\_
3. Education level (Tick one):
  - No Education
  - Primary Level
  - Secondary Level
  - Tertiary Level
4. Distance to reach facility from home (either by time on foot or by vehicle)
  - 4.1: time by foot:                    \_\_\_\_\_ (Hrs/Minutes)
  - 4.2: time by vehicle:                    \_\_\_\_\_ (Hrs/Minutes)

**SECTION B: PERCEIVED QUALITIES OF FMS**

Respondents will express their opinion or experience on a four-point Likert scale (1 - 5), where Completely Disagree (1), Disagree (2), Agree (3), Completely Agree (4) and Don't Know (5). For each aspect/question please tick in the appropriate box provided on the right.

| Aspects   | Completely Disagree (1) | Disagree (2) | Agree (3) | Completely Agree (4) | Do not know (5) |
|---|-------------------------|--------------|-----------|----------------------|-----------------|
| <b>Q5: Health Facility</b>  |                         |              |           |                      |                 |
| 5.1 In your opinion, the number of health staff in the health facility is <b>adequate</b> .   |                         |              |           |                      |                 |
| 5.2 In your opinion, the health staff in the health facility are <b>well suited</b> to treat women's health problems.                             |                         |              |           |                      |                 |
| 5.3 In your opinion, the waiting rooms, examination rooms and other rooms of the health facility are <b>adequate</b> for women's health problems. |                         |              |           |                      |                 |
| 5.4 In your opinion, the provision of clean drinking water for women in the facility is <b>adequate</b> .   |                         |              |           |                      |                 |
| 5.5 Hand washing facilities for women in the facility are <b>adequate</b> .   |                         |              |           |                      |                 |
| 5.6 Bathing facilities for women in the facility are <b>adequate</b> .  |                         |              |           |                      |                 |
| 5.7 Toilets for women in the facility are <b>adequate</b> .   |                         |              |           |                      |                 |
| 5.8 In your opinion, the overall environment of the health facility is <b>very clean</b> .  |                         |              |           |                      |                 |
| 5.9 In your opinion, the equipment in the health facility is <b>well suited</b> for detecting women's health problems.                            |                         |              |           |                      |                 |
| 5.10 The distance from your home to the health facility is <b>very far</b> .  |                         |              |           |                      |                 |
| Aspects   | Completely Disagree (1) | Disagree (2) | Agree (3) | Completely Agree (4) | Do not know (5) |
| <b>6. Health Care Delivery</b>  |                         |              |           |                      |                 |
| 6.1 In your opinion, the health staff in the health facility examines pregnant and postpartum women <b>well</b> .                                 |                         |              |           |                      |                 |
| 6.1 In your opinion, the health staff in the health facility is <b>very capable</b> of finding out what is wrong with the patients.               |                         |              |           |                      |                 |
| 6.2 In your opinion, the health staff in the health facility prescribe the <b>drugs that are needed</b> .   |                         |              |           |                      |                 |
| 6.3 In your opinion, the drugs supplied by this health facility are <b>good</b> .   |                         |              |           |                      |                 |
| 6.4 In your opinion, patients can obtain drugs from this health facility <b>easily</b> .  |                         |              |           |                      |                 |
| 6.5 The health facility provided <b>very much privacy</b> during vaginal examination and delivery.  |                         |              |           |                      |                 |
| 6.6 You felt <b>very much</b> of unnecessary and humiliating procedures during antenatal and delivery care.                                       |                         |              |           |                      |                 |
| 6.7 In your opinion, the information of danger signs of delivery and postpartum provided by health staff is <b>adequate</b> .                     |                         |              |           |                      |                 |

| Aspects  | Completely Disagree (1) | Disagree (2) | Agree (3)             | Completely Agree (4)            | Do not know (5) |
|--|-------------------------|--------------|-----------------------|---------------------------------|-----------------|
| <b>7.0 Interpersonal Aspects</b>   |                         |              |                       |                                 |                 |
| 7.1 In your opinion, the health staff in the health centre are <b>very open</b> with the patients.               |                         |              |                       |                                 |                 |
| 7.2 In your opinion, the health staff in the health facility are <b>very compassionate</b> towards the patients. |                         |              |                       |                                 |                 |
| 7.3 In your opinion, the health staff are <b>respectful</b> towards the patients                                 |                         |              |                       |                                 |                 |
| 7.4 In your opinion, the time that the health staff devote to their patients is <b>adequate</b> .                |                         |              |                       |                                 |                 |
| 7.5 In your opinion, the health staff in the health facility are <b>very honest</b> .                            |                         |              |                       |                                 |                 |
| <b>8.0 Overall</b>   |                         |              |                       |                                 |                 |
| 8.1 You were <b>completely satisfied</b> with the services provided to you                                       |                         |              |                       |                                 |                 |
| 8.2 In the case of your <b>future delivery</b> or next baby, will you again use this the health care facility?   | yes                     | No           | Undecided/do not know |                                 |                 |
| 8.3 Is there any service you have paid for for your maternal care (ANC, Delivery, PNC)                           | Yes                     | No           |                       | If Yes, which service?<br>_____ |                 |

***Information to read to respondent/s:***

**Introductions**

- I am here today with my colleagues working on a project that will be assessing the effects of implementing the FMS programme which is part of the Ministry of Health.
- We are collecting information to learn how the implementation process has progressed and the effects on the quality of health care
- We are interested in hearing from those who are directly involved with this programme

**Purpose:** The information collected from these tool will be used to describe the readiness of this facility to implement the FMS programme. The effects of FMS on the health services delivery will also be described. In addition, the information gathered will be used to provide inputs for the development of the FMS policy and also provide recommendations for the effective and efficient implementation of the FMS programme.

**Data Source:** MCH personnel who are knowledgeable on standard MCH services. This may include Nurses
